

PHASE 4

Business Rule, Security & Validation

1. Objective

Enforce the one-request-per-year policy at the backend and control access using roles, groups and ACLs.

2. Duplicate Request Business Rule

Business Rule Name: Laptop request BR. Table: Laptop Request Form. Run: Before Insert. Advanced: Enabled.

Navigate to All > System Definition > Business Rules.

Click New.

Name the rule Laptop request BR.

Select Laptop Request Form as the table.

Enable Advanced.

Set When to run: Before.

Enable Insert.

Add the validation script that checks the requester for an existing request in the current calendar year.

If a duplicate exists, block insertion and display an error message.

3. Business Logic

When a new request is submitted, identify the requester.

Check existing laptop requests for the current calendar year.

If a matching request exists, prevent the new record from being created.

Display a clear duplicate-request error to the employee.

Business Rule configuration and duplicate validation result.

4. Role Creation

Navigate to All > User Administration / Users and Groups > Roles.

Click New.

Create it_manager and it_employee roles.

5. Group Creation & User Mapping

Assign users to the appropriate group and assign the corresponding role to each group.

groups, members and assigned roles.

6. ACL Configuration

Use table-level ACLs (tablename.none) to provide consistent access control.

Enable the required elevated administrative role before creating ACLs.

Navigate to All > System Security > Access Control (ACL).

Create a Read ACL for Laptop Request Form with role it_manager.

Create Create, Read and Write ACLs for Laptop Request Form with role it_employee.

Save and test the ACLs.

Read, Create and Write ACL records.

7. Security & Functional Validation

test results / impersonation validation.

Role	Purpose
it_manager	View-only access for managers
it_employee	Create and manage laptop requests

Group	Role	Members
IT Managers	it_manager	8 users
IT Employees	it_employee	10 users

Role	Operation	Expected Access
it_manager	Read	View laptop request records
it_employee	Create	Create laptop requests
it_employee	Read	View requests and status
it_employee	Write	Modify permitted request records

Test Scenario	Expected Result
Employee creates request	Allowed
Employee edits request	Allowed
Employee submits second request in same year	Blocked
Manager views request list	Allowed
Manager tries to edit/create	Blocked
