

1. Project Conclusion

The Employee Laptop Request Management System successfully provides a secure, centralized and automated solution for managing employee laptop requests in a new IT organization.

2. Key Achievements

End-to-end automated request lifecycle.

Centralized digital request submission.

Basic and Advance request classification.

One-request-per-employee-per-year policy enforcement.

Manager approval through Flow Designer.

Automatic status updates.

Role-based security using roles, groups and ACLs.

Email notifications for important lifecycle stages.

Controlled deployment through update sets.

3. Technical Skills Demonstrated

ServiceNow custom application development.

Table and field configuration.

Record Producer and Service Catalog configuration.

Flow Designer automation.

Business Rule backend validation.

Roles, groups and ACL security.

Update Set preview, conflict resolution and deployment.

4. End-to-End Process

Employee opens the Laptop Request Record Producer.

Employee enters request details and submits.

Request is inserted into Laptop Request Form.

Business Rule checks for an existing request in the current year.

Valid request starts as Pending Approval.

Flow Designer sends approval to the manager.

Manager approves or rejects.

Request status is updated automatically.

Employee receives the decision notification.

IT receives a post-approval notification for fulfillment.

5. Future Enhancements

Create automated IT fulfillment tasks.

Integrate with Asset Management for laptop assignment.

Build management dashboards and reports.

Add SLA tracking.

Add approval escalation for overdue decisions.

Integrate with employee onboarding systems.

6. Final Statement

This project demonstrates practical ServiceNow skills across application development, data modeling, automation, backend validation, security and deployment. It provides a scalable foundation for expanding the laptop request process into a complete IT fulfillment solution.
